

1. Disassemble broken adapter. Discard core & nut. You may need to use a vise to prevent the core from spinning.

2. Place Teflon washer on the body, wet O-ring w/brake fluid, and place on the new core. Brush swivel to clean.

3. Re-assembly, tighten swivel snugly. If the swivel leaks, replace with AffinityEG swivel #BASA.

AffinityEG brake adapter rebuild kit includes a new core, Teflon washer & serrated nut.

Note: RBK-BA04 **does not** work for the older style body with the short internal ring. Replaces only newer core with the tall base as shown.

If any pins have fallen out of the old body, replace the entire brake adapter
